

Terminology API

Standardize & classify
healthcare codes
and concepts

Make sense of healthcare codes and concepts

Almost all C-CDAs contain uncoded or poorly coded data. Mapping and classifying inputs using standard code systems can improve your clinical data files, resulting in better data analysis, visualizations, and aggregation for various applications.

Increase in correct data

Standardize

Take an input code and/or free text and find matching codings from reference code systems. The specific reference code systems used depends on the domain (e.g., medication codes may use codings from RxNorm and NDC; report types may use LOINC and SNOMED).

Classify

From an input coding, get a set of classifications based on the domain (e.g., medication code may be classified by ingredient and strength; condition by clinical category and acute vs chronic).

Why use CareEvolution's Terminology?

Versatile

The Terminology API makes sense of your healthcare data regardless of the terminology used—even free-text.

Automated

The Terminology API automatically maps coded or uncoded clinical data to multiple reference code systems, then further classifies them based on domain.

Cloud native

Terminology has modern, cloud native architecture.

Proven

Terminology has been developed and refined by CareEvolution® over the past 15+ years.

Learn more about the Terminology API 

Unlock the full potential of Terminology as part of a flexible suite of Orchestrate technology.

CareEvolution's Orchestrate technology and APIs liberate, aggregate, standardize, enrich, and transform data to power patient-centric use cases.

Identity

Enable PPRL across data sources and use cases

Terminology

Standardize and classify healthcare codes and concepts

Convert

Transform input data from one standardized format to another

Insight

Compute hierarchical condition category (HCC) risk adjustment profiles
